# Assignment 8 - Web log evaluation
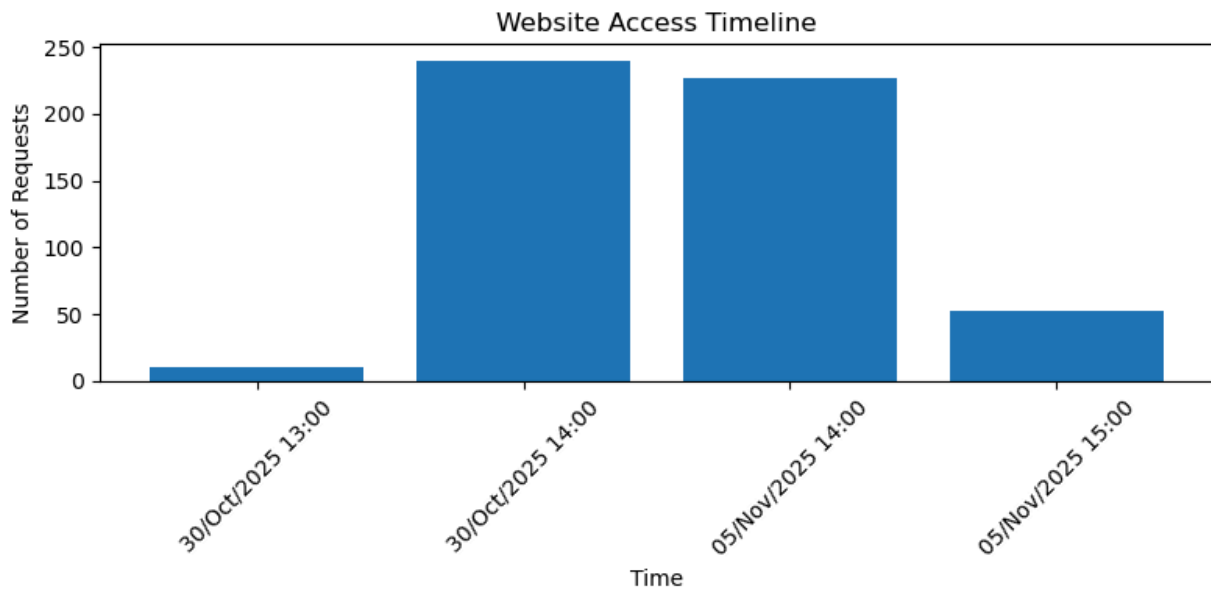

## Image for access logs:

## Image for error logs:

X

Summary:
During this analysis, the Apache access log showed normal traffic from localhost with multiple page requests to the FlavorFinder web application. The error log mainly contained SSL configuration warnings due to the self-signed certificate used in the XAMPP environment and server start/stop notices.
No major PHP or runtime errors occurred.
The generated timelines visualize when pages were accessed and when server warnings were logged.
